Ambridge Mobile is an iOS and Android App designed to make the Ambridge Historic District and Businesses more accessible. This guide will explain how to use the app and how to add/edit posts, markers, locations, and businesses.

App Overview

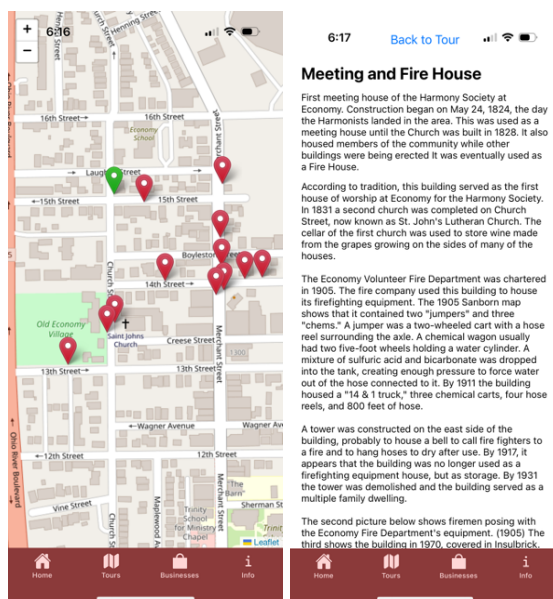

Ambridge Mobile follows a standard format for Apps, with four tabs, **Home**, **Tours**, **Businesses**, and **Info**.

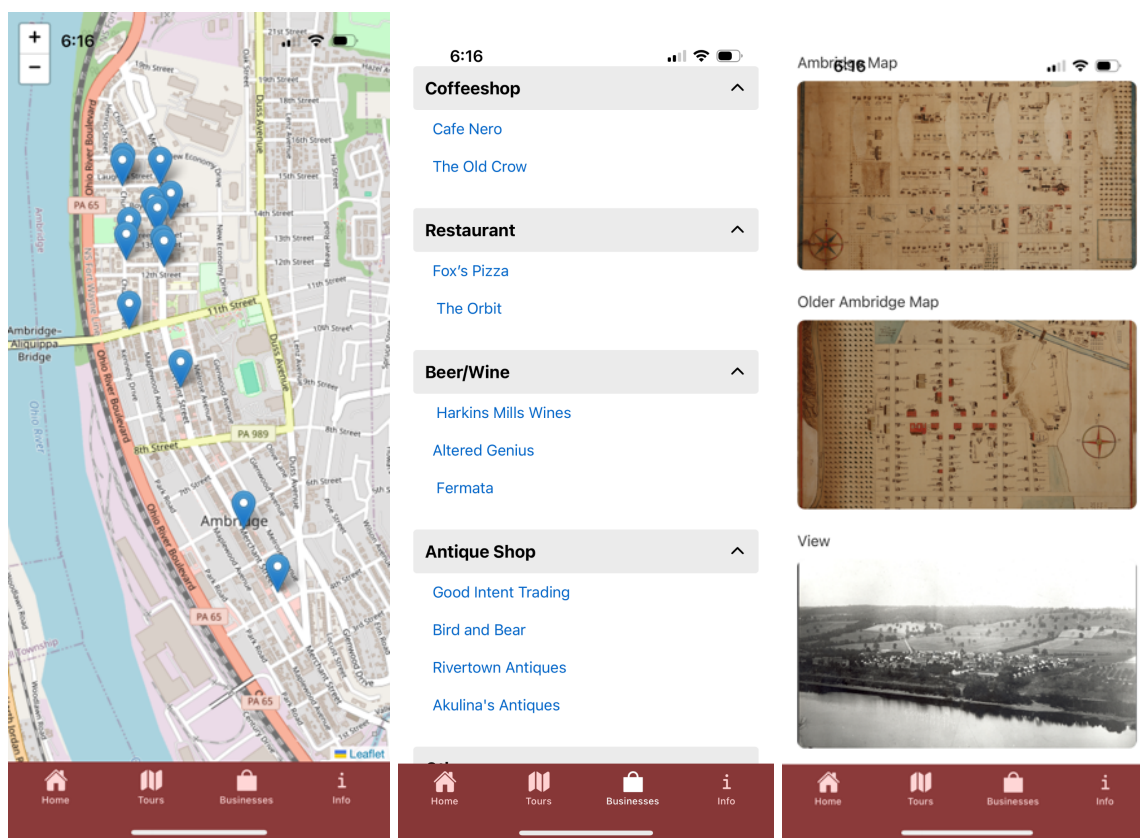

Shown here are the Home and Info pages. Home displays some of the posts from the Ambridge Historic District Facebook account. Info has contact details.

From left to right: the tour screen, “All Locations” tour, and popup that appears when you click on a marker. For this tour, only a title, short description, and one image is used per popup.

From the left, this is the “Markers” tour which can be selected underneath the “All Locations” tour. Rather than a pop-up, selecting a marker will result in a page being pulled up. It has both a short description, a longer and more descriptive description, and up to four images. This is used for the table-top markers found in the Historic District. In addition, clicking a marker will result in the color changing to green, showing that you’ve already selected it.

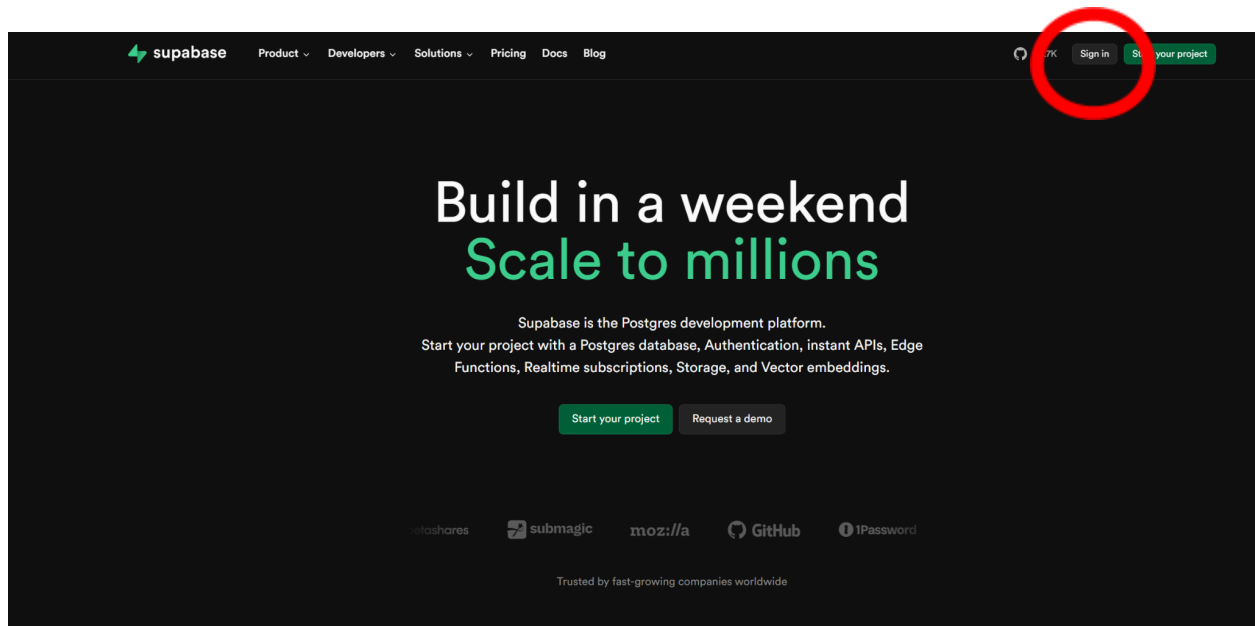

The businesses are displayed using a “Businesses” tour found under “Tours” and a separate tab called “Businesses”. The map is similar to the “All Locations” tour, displaying a pop-up with category, image and description. Clicking on a business in the right screen will pull up a page with the same. Lastly, Resources, found under “Tours” as the last option, allows for images not specific to any marker or

location, but still significant and interesting. It allows for an image and description. The image can be clicked, allowing the user to view it in full. I will now explain how to add and modify the markers and businesses below.

Login to Supabase

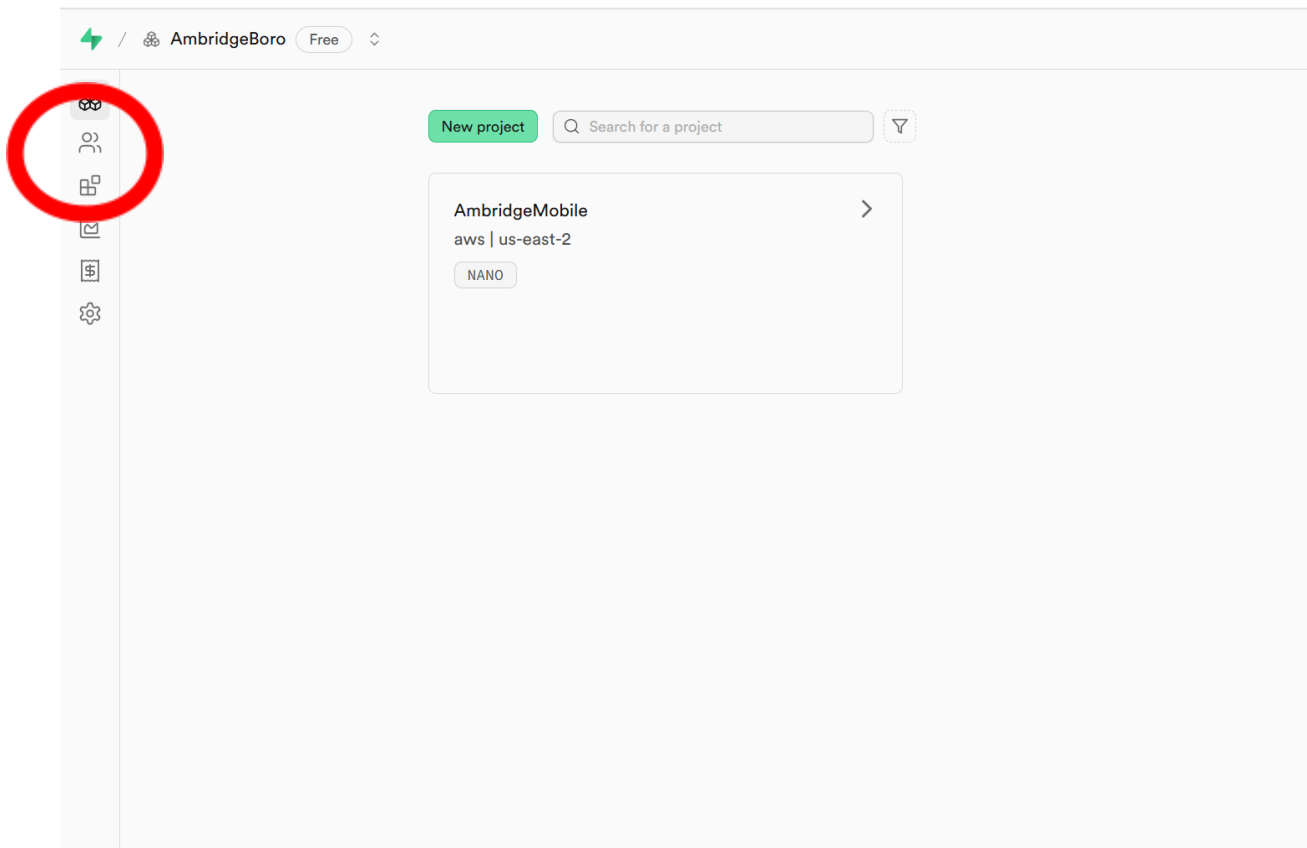

The data on Ambridge Mobile is stored on a website called supabase, found at supabase.com. Supabase functions as an online spreadsheet, similar to other spreadsheet software like Microsoft Excel. The Ambridge Mobile app accesses the spreadsheets and displays the information. Thus, the content of the app is controlled purely in Supabase and can be done by anyone regardless of technical expertise.

When you first visit supabase.com, you will want to click sign in, as shown in the image. The login details are as follows:

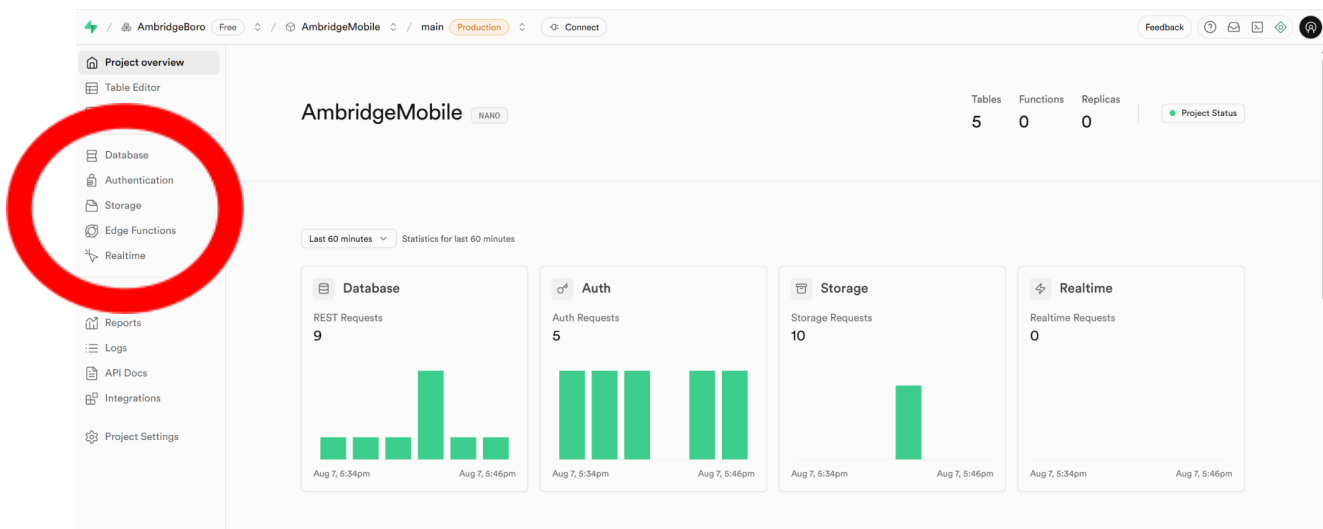

{Redacted}

You will be greeted by “Your Organizations”. You will want to click “AmbridgeBoro” which should be the first and only option.

To access the project, you must click “AmbridgeMobile”, the main option on the screen above. Circled is an option on the left toolbar which resembles two people. This is the “Team” page. If you want to add another user to the project by email, you can do that there. For a user to be able to edit the project, they must have “Owner” status.

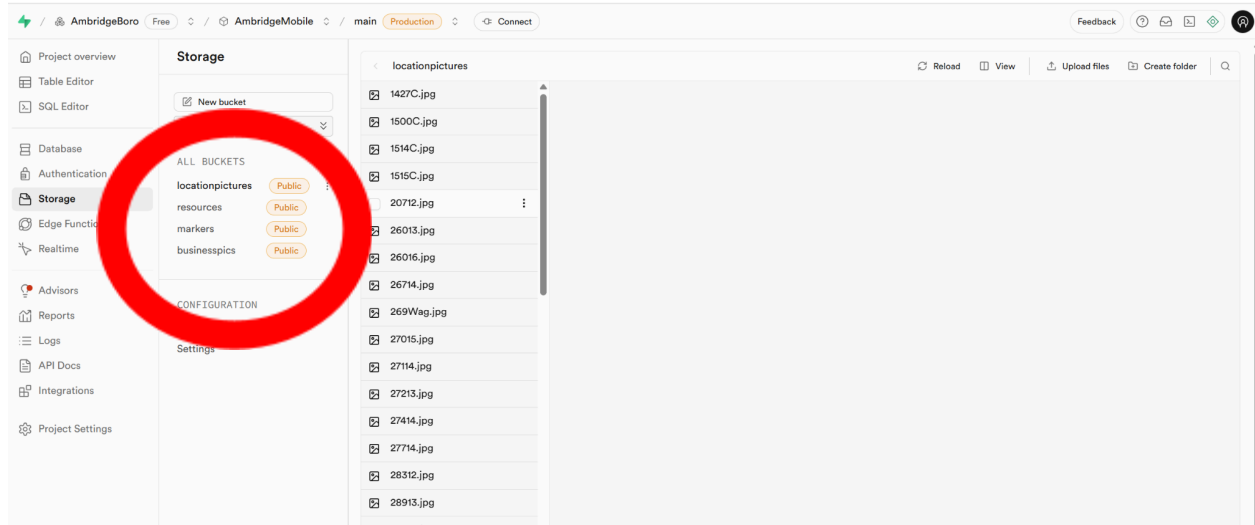

Editing Content

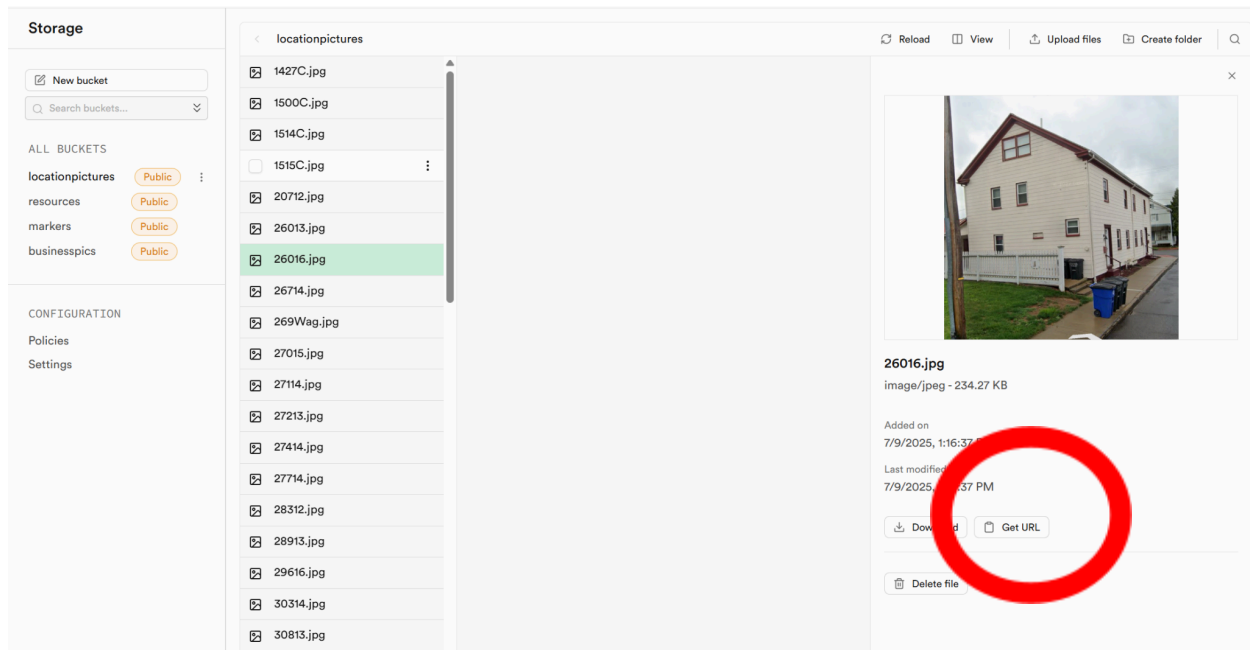

Once you click “AmbridgeMobile” you will be greeted by this more complicated screen. The left toolbar will be what will be used. It may not initially appear, so you may have to hover over the left side with your mouse for it to appear. As circled, there are two options that will be important when adding or editing content: “**Database**” and “**Storage**”. **Database** contains most material, including text, coordinates, categories, and more. **Storage** is used purely for images, which will be explained first. To add any picture to Ambridge Mobile for any category or item, click **Storage**.

Adding Pictures (For Markers and Businesses)

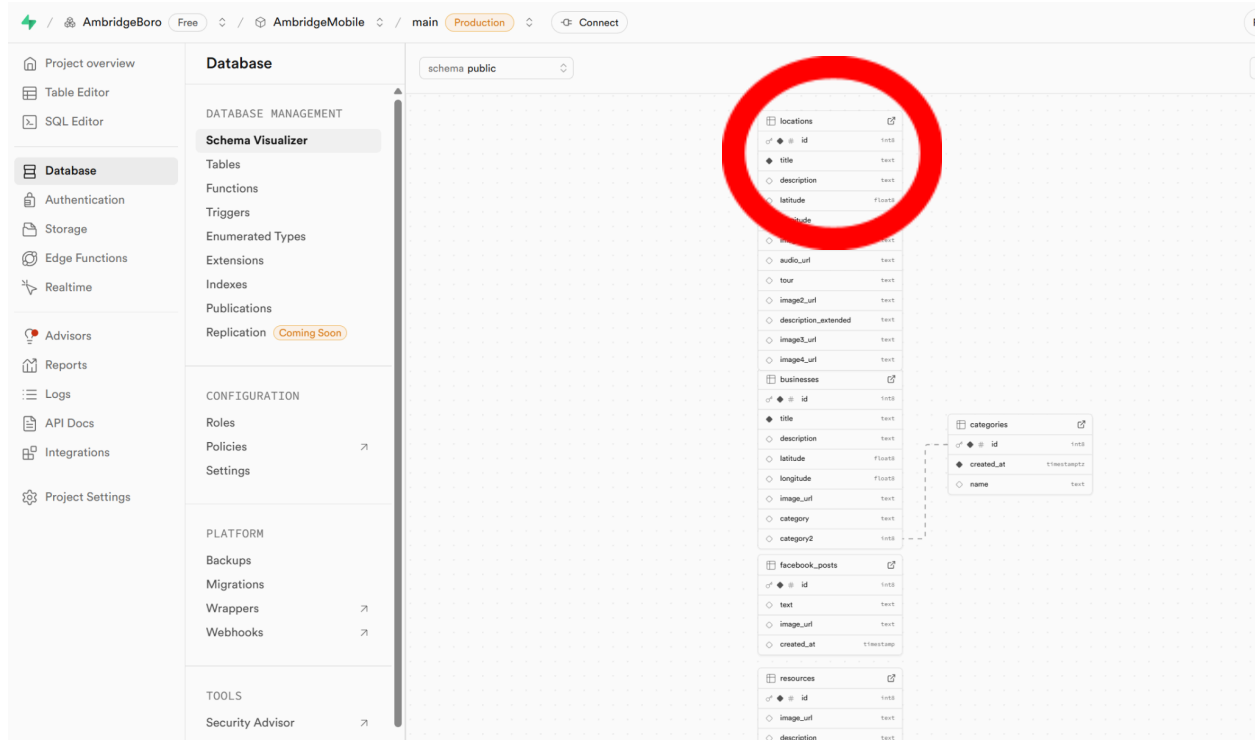

If any picture is going to be added, it must be added to Storage. Make sure your image is downloaded on your computer and can be found using the file explorer. Once Storage has been clicked, you will be greeted with this screen. There are two important parts, as seen on this screen. The left circle shows the list of buckets, which function like folders on a computer. There are four buckets shown for each category. Based on the category of the image you are adding, click the desired bucket. In the image above, locationpictures is selected. Then you must click “Upload files” as shown in the top right circle. This will open your file explorer and you can find your image from there. I recommend uploading images in .jpeg or .jpg format, although .png files will also be accepted. The uploaded picture will take the same name as the original file. To add the picture to the larger database, the next step is to click the image as shown on the next image.

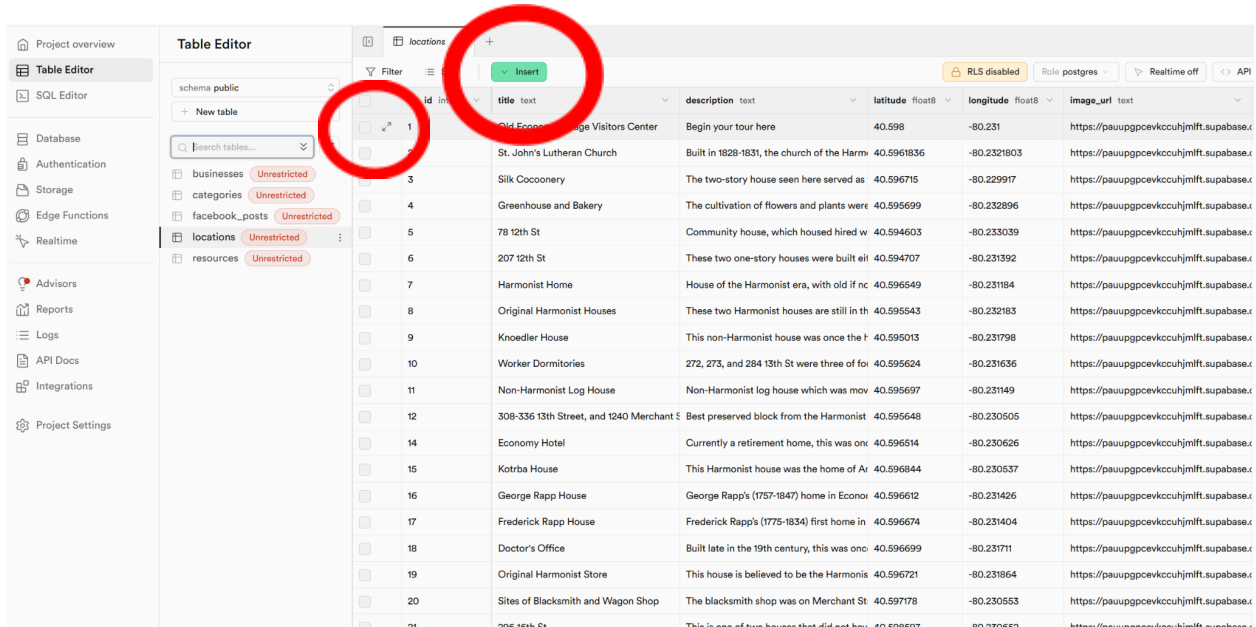

As shown, click the image you uploaded. Here, I've clicked 26016.jpg. It is highlighted in green on the screen. As you can see on the bottom right, options for the image will appear. You want to select "Get URL". This will copy a unique url of your image to your clipboard, where you can then paste it anywhere you please, including a cell in the Database. The url is how the app knows to access this specific image and display it. Now that you've uploaded the picture of the location or business, you can now add it to a new or existing location in the image_url field, as I will show below. On the left-most toolbar, you want to select **Database**.

Once you click **Database**, you will see this screen. On the right-hand side, there are four tables stacked top to bottom. You will notice them titled: **locations**, **businesses**, **facebook_posts**, and **resources**. “Locations” is used to create any historic tour checkpoint, whether it be a short pop-up or a full marker.

“Businesses” is where all businesses should be stored. “Facebook_posts” are where the newest Historic District facebook posts will appear and “Resources” is where any other images not related to a specific tour checkpoint should be stored so they appear on the resources screen from above. To access the table you want, click the box with an arrow sticking out of it, as shown in the red circle above, next to the table you want to edit. Each table has that icon next to it.

Adding/Modifying a Short or Long Historic Marker

The screenshot shows the 'Table Editor' interface for a table named 'locations'. The interface includes a sidebar with navigation options like 'Project overview', 'Table Editor', 'SQL Editor', 'Database', 'Authentication', 'Storage', 'Edge Functions', 'Realtime', 'Advisors', 'Reports', 'Logs', 'API Docs', 'Integrations', and 'Project Settings'. The main area displays the table structure and data. The table has columns: 'id', 'title', 'description', 'latitude', 'longitude', and 'image_url'. The 'locations' table is highlighted in the sidebar, and its data is shown in the main area. Two red circles are drawn on the interface: one around the 'Insert' button in the top right corner, and another around the double-click edit icon in the first row of the table.

Clicking the “locations” table should show this screen. As you can see, there are rows and rows of locations, many which should be familiar. To quickly modify anything already on the table, simply double-click the cell you want to modify. It will show the full contents of the cell and be editable. Otherwise, to look more closely at a row, you can do two things. To look at an existing location, you want to click the two outward facing arrows, as shown in the left circle. Hovering over any row will cause this icon to appear. To create a new location, select “Insert” as shown in the right circle.

St. John's Lutheran Church

Optional Fields

These are columns that do not need any value

description

text

Built in 1828-1831, the church of the Harmony Society saw service twice on Sunday until the Society closed in 1905. Afterwards the building held services for all denominations before churches were built in the newly-founded town of Ambridge.

Page 1 of 1

100 rows

36 records

With either option, a screen similar to this will appear. (Will be empty if creating a new location) The view seen can be scrolled down to view more fields. The chart below explains each field and what should be included.

id	This is an automatically generated number. Do not edit this field.
title	This is the name of the location. Ex. Economy Hotel, Silk Cocoonery
description	This is a short description to give a basic overview. This is the only text which will be shown on the “Short Marker” or the marker which appears on the “All Locations” tour.

latitude	A number preferably two digits with four-six decimal places. Ex. 40.596183. All Ambridge latitudes will start with 40. I will explain how to get latitude and longitude below. Latitude and Longitude are required for a location to appear on the tour.
longitude	A number with two digits and four-six decimal places. Ex. -80.232180. All Ambridge longitudes will start with -80. (Do not forget the negative)
image_url	This is where you will paste the url you copied from Storage of the image you want to add. Make sure no additional characters are in this field other than the url of the desired image. This is the first image field and the only one that will appear on the “All Locations” tour, so it should be the most important image for that location.
audio_url	Not currently used
tour	This field is a singular character and is what distinguishes short and long historic markers. A short historic marker will include a short description and one image, while a long marker includes a much longer description and up to four images. If the location is a short marker, it should be marked “ L ” with no spaces or additional characters. If it has the content for a long marker, it should be marked “ M ”. These are the only two options. Keep in mind that all long markers will appear on the “All Locations” tour as a short marker in condensed form, but short markers will not appear on the “Markers” tour.
image2_url	This is where you can add a second image for long markers. Copy-paste the url from Storage , where you upload the picture.
description_extended	This longer description should be multiple paragraphs, like what is seen on a tabletop marker. Only needed for long markers.
image3_url	Add the url for a third image, if needed
image4_url	Url for fourth image, if needed

Only the latitude and longitude are required fields, but it is recommended to fill out most fields. Once every field is filled out, click **Save** at the bottom right of the screen once scrolled down. I will also discuss steps for finding the latitude and longitude below.

Address

[Get GPS Coordinates](#)

DD (decimal degrees)

Latitude

Longitude

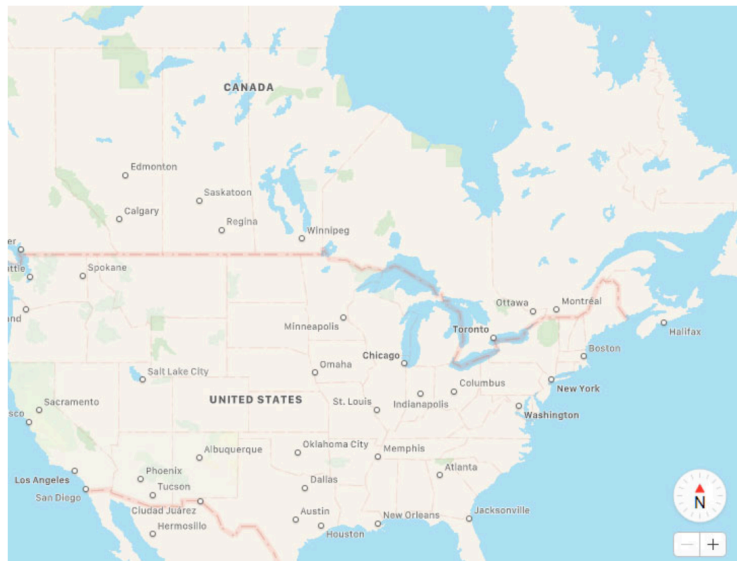

[Get Address](#)

DMS (degrees, minutes, seconds)

Latitude ° ' "

Longitude ° ' "

[Get Address](#)

There are many ways to find latitude and longitude, but it is most easily done online, where there are many sites that do this. The one shown is <https://gps-coordinates.org/>. Simply enter the address of the location and select “Get GPS Coordinates” and they will appear on screen. You can then copy-paste them into the Database. Keep in mind four-six digits after the decimal point are recommended.

Clicking the “businesses” table under the Table Editor should display this screen.

As with the locations table, hover over an existing row and click the outward arrow icon to modify an existing business or click Insert to create a new business.

The screenshot shows a database management interface. On the left, a table with 17 rows is visible. The columns are 'id', 'title', and 'description'. The 'id' column contains numbers 1 through 17. The 'title' column contains business names like 'The Old Crow', 'Rivertown Antiques', 'The Orbit', 'Akulina's Antiques', 'Bird and Bear', 'Good Intent Trading', 'Cafe Nero', 'The Epochary Inn', 'Heslet House', 'Fox's Pizza', 'Altered Genius', 'Fermata', 'Harkins Mills Wines', and 'Laughlin Memorial Library'. The 'description' column contains brief descriptions of each business. On the right, a form titled 'Update row from businesses' is shown. It has fields for 'id' (int8), 'title' (text), 'description' (text), 'latitude' (float8), 'longitude' (float8), and 'image_url' (text). The 'title' field is filled with 'Rivertown Antiques'. The 'description' field is filled with 'Rivertown Antiques is located in a former bowling alley and offers 7500 sq. ft. of vintage items for your shopping pleasure. Hours — open seven days a week'. The 'latitude' field is filled with '40.596' and the 'longitude' field is filled with '-80.2308'. The 'image_url' field is filled with 'https://pauupgpcevkcckuhjmlft.supabase.co/storage/v1/object/public/locationpictures/rivAnt.jpg'.

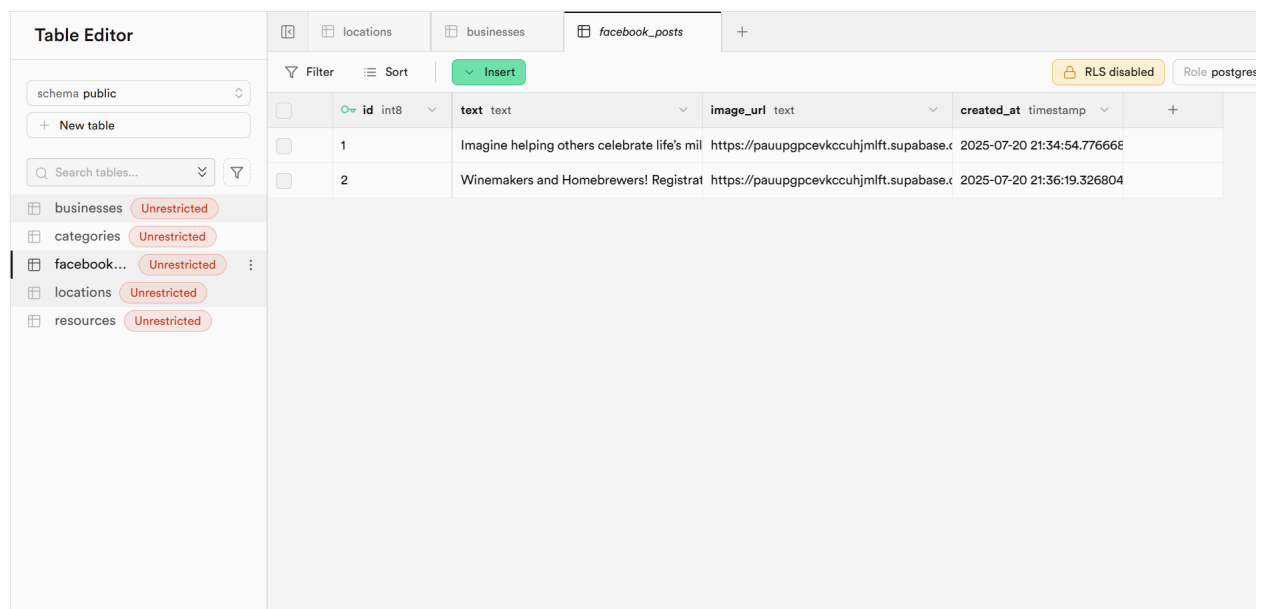

The table below explains each field in a row for the business table:

id	An automatically generated number. Do not edit this.
title	Name of business
latitude	Number used for mapping the location on business map. See prior table and instructions.
longitude	Number used for mapping the location on business map. See prior table and instructions.
image_url	Paste your image url from Storage here.
category	This field will be the category of the business. The available categories are: Coffeeshop, Restaurant, Antique Shop, Stay, Beer/Wine . For it to be under one of these categories, it must be spelled exactly as shown, first letter capitalized . If it does not fall under any of those categories, type Other .
category2	Not used

Only title and category are required for the business to show up on the “Businesses” tab of the App, but latitude and longitude must be completed for the location to appear on the map. Once you fill out all the required fields, click Save at the bottom right after scrolling down to save the business.

Adding/Modifying Facebook Posts or Resources

There are two other tables, facebook_posts and resources. The facebook_posts are displayed on the home page of the app, while the resources are shown on the Resources page under “Tours”.

The screenshot shows the 'Table Editor' interface for a database. On the left, a sidebar lists tables: 'businesses', 'categories', 'facebook_posts', 'locations', and 'resources', each with an 'Unrestricted' label. The main area displays the 'facebook_posts' table with columns: 'id' (int8), 'text' (text), 'image_url' (text), and 'created_at' (timestamp). Two rows of data are visible. The interface includes a 'Filter' button, a 'Sort' button, and an 'Insert' button. A status bar at the top right indicates 'RLS disabled' and 'Role: postgres'.

	id	text	image_url	created_at
	1	Imagine helping others celebrate life's mil	https://pauupgpcevkccuhjmft.supabase.c	2025-07-20 21:34:54.77666E
	2	Winemakers and Homebrewers! Registrat	https://pauupgpcevkccuhjmft.supabase.c	2025-07-20 21:36:19.326804

The facebook_posts table is much simpler and easier to manage. The content should appear automatically from the historic district facebook page, but there may be spelling errors. The text field contains the text from the post, while the image_url field contains the url of the image from the post.

The resources table is very similar. The image_url, taken from Storage, should be pasted there as well as a description.

Conclusion

This guide should be the comprehensive overview of Ambridge Mobile and maintaining it. If any additional issues arise, feel free to contact me at shankerpillai1@gmail.com. Any change in the table will be immediately reflected in the App once the App is restarted. I hope that Ambridge Mobile can be a valuable resource for Ambridge in the coming years.
